

This diagram describes the steps taken by a client to bootstrap a new account.

A client will need to query the principal resource for a user in order to find relevant information about that user, such as the location of the user's calendar home(s), the user's calendaring addresses on the server, and so on. Bootstrapping therefore requires a means to locate the user's principal resource.

Given the URL to the principal resource, this is rather easy.

Given a scheduleto: URL (which is similar to a mailto: URL or email address), this needs to be mapped to the principal URL, as shown below.
